Dispatch pilot

Four-week operations review

Observe for two more weeks before deciding on rollout

Fictional demonstration. All observations and data are invented.

On-time dispatch reached 95% in week 4

95%

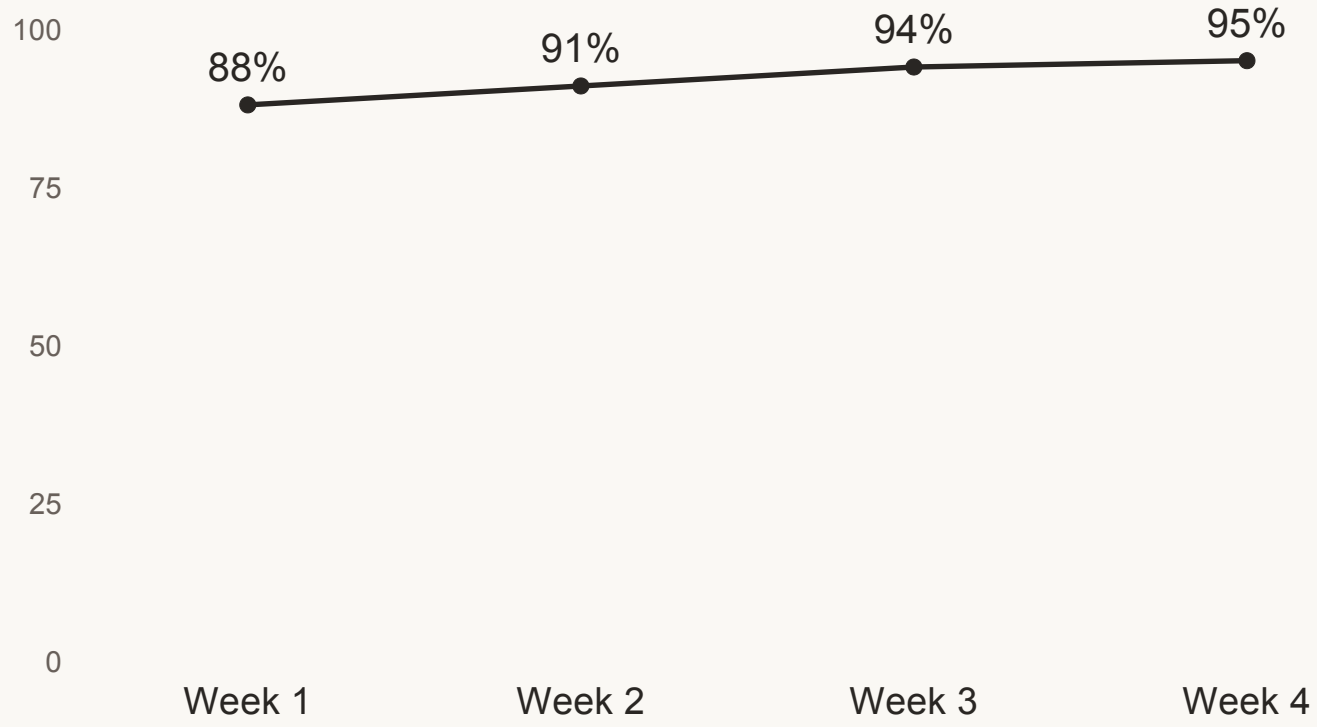

88% baseline

On-time = carrier handover before the agreed cutoff; cancelled orders excluded.

2,400 pilot orders at one warehouse; a separate 2,000-order baseline. Different order mixes prevent a causal conclusion.

Fictional demonstration. All observations and data are invented.

On-time dispatch across the pilot

The four pilot weeks show an upward pattern. The source does not establish why.

Illustrative rounded rates. Per-week denominators are not provided.

On-time = carrier handover before the agreed cutoff; cancelled orders excluded.

Compare performance and measurement limits

Metric	Baseline	Week 4	Definition
On-time dispatch	88%	95%	Carrier handover before cutoff
Median pick time	14 min	11 min	Pick start to pick complete
Exception rate	6.0%	4.5%	Orders needing manual intervention

Exception counts and pick-time distributions are not supplied.

Fictional demonstration. All observations and data are invented.

Resolve the gaps before scaling

40 orders have missing handover timestamps

They were excluded from the on-time rate. Investigate the missingness before interpreting the result.

Only 8% of pilot volume came from weekend orders.

One warehouse; no cross-site replication completed.

Fictional demonstration. All observations and data are invented.

Extend observation; rollout remains undecided

Observe for two more weeks, investigate the 40 missing timestamps with operations, and include a fuller weekend sample.

Owner names and completion dates have not been supplied.

Fictional demonstration. All observations and data are invented.
